FAQ

[Fanuc Ladder Iii V6.3](#)

- #6 DUA The difference in error between the semi-closed loop and closed loop became too large when the dual position feedback function was being used.

Details of invalid servo parameter setting alarms (on the servo side)

Diagnosis	352	Detail number for invalid servo parameter setting alarm
-----------	-----	---

Indicates information that can be used to identify the location (parameter) and cause of an invalid servo parameter setting alarm (servo alarm SV0417).

This diagnosis information is valid when the following conditions are satisfied.

- Servo alarm No. 417 has occurred.
- Bit 4 of diagnosis No. 203 (PRM) = 1

See the following table for the displayed detail numbers and the corresponding causes. For further detail information that could be used to take measures, refer to FANUC AC Servo Motor α s/ α i/ β is series Parameter Manual (B-65270EN).

• Detailed descriptions about invalid servo parameter setting alarms

Detail number	Parameter number	Cause	Measure
0233	2023	A value specified as the number of velocity pulses is greater than 13100 when initialization bit 0 = 1.	Decrease the value specified as the number of velocity pulses to within 13100.
0243	2024	A value specified as the number of position pulses is greater than 13100 when initialization bit 0 = 1.	Decrease the value specified as the number of position pulses to within 13100. Use the position feedback pulse conversion coefficient (No. 2185).
0434 0435	2043	The internal value of the velocity loop integration gain has overflowed.	Decrease the value specified in the velocity loop integration gain parameter.
0444 0445	2044	The internal value of the velocity loop proportional gain has overflowed.	Use a function (No.2200#6) for changing the internal format of the velocity loop proportional gain. Alternatively, decrease the setting of this parameter.
0474 0475	2047	The internal value of the observer parameter (POA1) has overflowed.	Change the setting to: $(-1) \times (\text{desired setting})/10$
0534 0535	2053	The internal value of the dead zone compensation parameter has overflowed.	Decrease the setting until the invalid parameter setting alarm will not occur any longer.
0544 0545	2054	The internal value of the dead zone compensation parameter has overflowed.	Decrease the setting until the invalid parameter setting alarm will not occur any longer.
0694 0695 0696 0699	2069	The interval value of the velocity feed forward coefficient has overflowed.	Decrease the velocity feed forward coefficient.
0754 0755	2075	The setting of the parameter listed at the left has overflowed.	This parameter is presently not in use. Specify 0 in it.
0764 0765	2076	The setting of the parameter listed at the left has overflowed.	This parameter is presently not in use. Specify 0 in it.
0843	2084	No positive value has been set for the flexible feed gear numerator. Alternatively, the following condition exists: Feed gear numerator > denominator \times 16	Specify a positive value as the flexible feed gear numerator. Alternatively, satisfy the following condition: Feed gear numerator \leq denominator \times 16 (except for phase A-/B-specific stand-alone type detector).
0853	2085	No positive value has been set as the flexible feed gear denominator.	Specify a positive value as the flexible feed gear denominator.
0884 0885 0886	2088	The internal value of the machine velocity feedback coefficient has overflowed.	Decrease the machine velocity feedback coefficient. Alternatively, use the damping control function, which has an equivalent effect.
